KH Booster

1000ml - Ref: 3048CW.

2500ml - Ref: 3049CW.

5000ml - Ref: 3050CW.

2.5DH per 10,000 litres.

2.5DH per 25,000 litres.

2.5DH per 50,000 litres.

KH is the measurement of carbonate hardness in water and is often the most overlooked parameter when testing water quality problems, and often responsible for unstable pond environments and very often unknown fish, water plant and mollusc losses.

If the KH is allowed to drop too low major swings in pH are normally observed, and if left unattended the pH can "crash" resulting in the death of the fish very quickly.

Nitrifying bacteria, cannot survive without KH. No KH means no biological filtration and in turn this allows the ammonia and nitrite toxins to rise and bringing a complete "crash" to the bio system of the pond.

TREATMENT:

To increase KH by 2.5DH, add 25ml of ClearWaters KH Booster for every 250 litres of pond water. This Gradually increase KH by adding KH Booster over a 24-48 hour period and re-test between doses. The correct KH for ponds is between 6 - 8DH. Mix KH Booster in a bucket of warm water and disperse evenly over the pond surface whilst avoiding direct contact with water plants.
